

01 / 07 Rayforce Cloud · Service proposal

A research workspace with market data already connected.

Choose the sources you need, add your own data and run queries or reusable analyses.

The proposed service covers data delivery, preparation and a managed Rayforce environment — the work needed before a dataset can support research.

AVAILABLE IN ONE WORKSPACE

01 Connected market data

Selected sources, history and maintained updates.

02 Your data and research

Positions, executions, custom queries and calculations.

03 Results you can use

Tables, recurring analyses and access through an API.

For quantitative research and portfolio analytics

02 / 07 The client's problem

A data subscription is the beginning of the work.

Before a team can answer a research question, someone has to make the data usable and keep the environment running.

01

Receive the data

Connect sources, track delivery, recover missed updates and load history.

02

Make it consistent

Parse formats, align identifiers and timestamps, validate fields and apply corrections.

03

Keep it queryable

Operate storage and compute, maintain datasets and run recurring workloads.

THE PROPOSED SERVICE TAKES CARE OF

The agreed data pipeline and Rayforce environment.

THE RESEARCH TEAM CONTROLS

The questions, calculations and use of the results.

The intended benefit is less recurring data and infrastructure work inside the client's team.

03 / 07 What the client gets

An environment the team can work in.

Connected datasets, managed compute and storage, and control over the analysis.

01 Create a workspace

A managed Rayforce environment for the team's data and analytical workloads.

02 Connect datasets

Review coverage, history and update frequency. Connect entitled market datasets and add internal data.

03 Run an analysis

Write custom queries or use maintained analysis templates. Access results through the workspace or API.

04 / 07 A concrete workflow

“Which instruments have unusual volume this morning?”

A reusable analysis over connected trade history, with the universe and comparison window chosen by the client.

1. Select the inputs

Trades or volume bars, session calendars and the client’s instrument list.

2. Run the calculation

Compare volume up to 10:00 with the average for the same session interval over the previous 20 sessions.

3. Work with the result

Inspect the ranked table, change the parameters or reuse the calculation through the API.

ILLUSTRATIVE OUTPUT

20-session baseline

Relative volume · 10:00

Instrument	Volume / baseline
Instrument A	2.4×
Instrument B	1.8×
Instrument C	1.2×

The result would include source timestamps and coverage status.

Example values for presentation purposes.

Rayforce is the engine inside the workspace.

The existing Rayforce engine combines columnar analytics and graph operations in a shared query plan.

Tabular analytics

Filters, joins, aggregations and window functions over structured data.

Relationship analysis

Graph traversal and algorithms for connected entities, such as instruments, funds and issuers.

Programmatic access

Rayfall for queries and a C API for embedding. The engine can also be used independently of the proposed cloud service.

From a subscribed source to a queryable dataset.

Data providers and delivery partners connect at the ingestion layer. Preparation makes their data usable inside the client's Rayforce workspace.

External sources and delivery

Integration into Rayforce Cloud

INTEGRATION BOUNDARY A delivery connector feeds the ingestion layer, which publishes prepared datasets to a client workspace.

Source-specific delivery

Files, APIs or streams can be considered according to the source. Each requires an appropriate connector and update policy.

Provider-independent design

The delivery layer could be supplied by a data partner or connected directly. Data access follows the client's entitlements.

07 / 07 The proposed offer

A workspace and data services for the team's research.

THE CORE SERVICE

A Rayforce environment

Managed compute, storage, query execution and client access. The team can bring its own datasets.

OPTIONAL DATA SERVICES

Maintained market datasets

Agreed sources, historical coverage, update frequency and correction handling, delivered through provider integrations.

THE ANALYTICAL LAYER

Queries and reusable analyses

Custom research alongside maintained templates, with results available in the workspace and through an API.

The client receives

A working analytical environment with agreed datasets and operating responsibilities, ready for the team's research workflows.

Defined for each setup

Data coverage and entitlements · history and update frequency · compute and storage · required analyses · support responsibilities

Rayforce is available today. Cloud and data services are the proposed offering.
