

Market data delivery brings the files. Rayforce makes them queryable.

A proposal to pair a market data delivery service with a managed Rayforce workspace: one path for the client from provider file to research result.

This deck explains what each side does today, where the gap is for the client, what the joint offering would look like, what each side gains, and a four-week pilot to test it on one real feed.

Two products that meet at one point: the delivered file.

What is live and what is still in preview is marked, so the proposal can be judged on what exists.

DELIVERY SERVICE

Live

Market data delivery

Managed market data file delivery for hedge funds and asset managers, run alongside their existing stack.

Configure, acquire, validate, deliver, confirm. Files from terminals, index and reference vendors and bank feeds, routed to the client's approved storage on schedule.

Operational checks, not data changes. File presence, delivery windows, integrity and checksums. Provider data is delivered as received, never rewritten.

Inside the client's entitlements. Hosted in the client's cloud or the service's own, under the client's existing licenses, with a support model the client chooses.

PROPOSER

Engine live

Cloud in preview

Rayforce

An analytics engine that fuses columnar queries, graph traversal and recursive rules in one pipeline.

Rayforce engine. Open source under MIT, one dependency-free C codebase under a megabyte, developed with Lynx, a trading firm. Filters, joins, windows, graph algorithms and vector search in one query plan.

Rayforce Cloud. A managed workspace on the engine: connected datasets, compute, storage and an API. A preview build runs today; the managed service and data services in this deck are the proposed offering.

Access. Rayfall, Python bindings and a C API. The engine also runs on the client's own servers, so there is no lock-in to the cloud service.

The description of the delivery side is deliberately generic. Where a delivery service does more or less than this, the boundary on slide 04 moves with it.

The file has landed. The research still cannot start.

Delivery checks run after files land and before downstream processing. That downstream processing is still done by the client's engineers, feed by feed.

01

Solved by delivery

Receive the data

Connect providers, scan for files, validate delivery, route to storage, confirm or alert. Monitored and predictable.

02

Still the client's work

Make it consistent

Parse each provider's format, map schemas, align identifiers and timestamps across feeds, load history, apply corrections.

03

Still the client's work

Keep it queryable

Run storage and compute, maintain tables as feeds change, serve queries and recurring calculations to people and systems.

WHAT DELIVERY FREES ENGINEERS FOR TODAY

Research, data processing and core infrastructure.

WHAT THE JOINT OFFERING WOULD FREE THEM FROM

Data processing and analytics infrastructure, so the time goes to research.

In practice the answer today lives in three tools: a vendor terminal, a spreadsheet and one analyst's head. Steps 02 and 03 are why a subscribed dataset can sit unused for weeks.

Provider file to queryable dataset, with a clean boundary.

Rayforce Cloud is one more delivery destination. The delivery confirmation triggers ingestion, and the delivered files stay in the client's storage as the system of record.

Market data delivery · live today

Rayforce · proposed addition

INTEGRATION BOUNDARY

One additional approved destination on the delivery side, one webhook or file-watch on the Rayforce side. No change to how files are acquired, validated or confirmed.

Provider data is never rewritten

Ingestion produces a separate, queryable copy. The original files, their checksums and the delivery record remain untouched.

Entitlements stay with the client

Rayforce Cloud operates under the client's existing licenses, the same way the delivery platform does today. Nothing is redistributed between clients.

Three questions a desk can ask the day the feed is connected.

Maintained analyses over files market data delivery already brings, joined with the client’s own positions.
Next to them, any query the team writes itself.

ANALYSIS	THE QUESTION A TRADER ASKS	FROM MARKET DATA DELIVERY	FROM THE CLIENT
Market activity	“What moved today, by how much and on what volume, compared with last month?”	Prices, trades and instrument reference data	An instrument universe, optional
Portfolio valuation	“What is my book worth right now, in one currency, broken down by issuer?”	Prices and exchange rates	Positions
Look-through exposure	“How much am I really exposed to one company, counting the funds I hold?”	Fund holdings and instrument-to-issuer links	Positions

Two kinds of questions, one engine

“How much?” is a question about rows and columns. “Who is connected to whom?” is a question about links between funds, companies and instruments. Most tools answer the first. Rayforce answers both in one query, so look-through exposure comes back as a single number with the path behind it.

Templates or the client’s own

Maintained analyses run with one click, next to calculations the team writes in Rayfall or Python. Results stay in the workspace or flow into existing dashboards and models through the API.

Every answer names its source file. Delivery already knows when it arrived.

The delivery record and Rayforce's lineage join into one chain: provider file, delivery confirmation, prepared table, result. A number can be traced back without a phone call.

Source and time on every result

Prices as of, positions as of, coverage and feed status are part of the output, not a footnote in someone's spreadsheet.

Corrections are applied and visible

When a provider restates yesterday's prices, the correction lands as a new version. The previous answer stays reproducible.

The delivery record is the anchor

Each prepared table references the delivered file and its delivery confirmation, so both teams look at the same identifier.

MOCK-UP

Workspace view

Result · Portfolio valuation

Value	USD [__]
Prices as of	[date, time]
Positions as of	[date]
Coverage	[n] of [n] instruments priced
Feed status	Up to date
Source	[provider file] · delivery [id, time]

Mock-up; values are placeholders.

What each side gains, stated plainly.

A partnership only holds if each side can see the other's interest. Both are listed here.

FOR MARKET DATA DELIVERY

A larger answer to the same client

Delivery plus analytics in one conversation

Clients of a delivery service ask what happens after the file lands. The joint offering gives delivery an answer without building a data platform.

Stickier accounts

A research workspace fed by the delivered files is harder to replace than a delivery pipeline alone.

A new revenue line with no engineering

Referral fee or revenue share on Rayforce Cloud subscriptions that originate from delivery clients. Terms to be agreed after the pilot.

FOR RAYFORCE

Distribution, and a delivery layer it does not have to build

Access to the right clients

Hedge funds and asset managers who already trust a delivery service with their feeds are exactly the teams Rayforce Cloud is built for.

A proven delivery layer

Acquisition, monitoring and alerting are solved on the delivery side. Rayforce stays focused on preparation, storage and query execution.

Real feeds to harden ingestion

Every provider format delivery brings becomes a maintained Rayforce connector, improving the product for every client after.

What Rayforce is not asking for: exclusivity, co-development, hosting or support obligations on the delivery side, or any change to delivery pricing.

Who does what.

One owner per layer, so the client never has two phone numbers for one problem.

AREA	OWNER	WHAT IT MEANS IN PRACTICE
Provider connectivity and acquisition	Delivery	Credentials, schedules, naming patterns and scanning for files, as today.
File validation, delivery and alerts	Delivery	Presence, windows, integrity and checksum checks, and the usual confirmation. Rayforce Cloud is one more destination.
Parsing, schema mapping, identifier alignment	Rayforce	A maintained connector per provider format. History loads and corrections handled in the workspace.
Storage, compute and workspace hosting	Rayforce	Managed Rayforce environment, in Rayforce Cloud or deployed into the client’s cloud next to the delivery platform.
Queries, analysis templates and API	Rayforce	Custom research by the client, maintained templates by Rayforce, results through the workspace and API.
Licenses and entitlements	Client	Unchanged. Both the delivery platform and Rayforce operate within the client’s existing data agreements.
Client relationship and first-line support	Shared	The side that introduced the client stays the account lead. Each side supports its own layer with an agreed hand-off.

Three ways to work together, from lightest to deepest.

Better settled around a real pilot than on paper. The recommendation is marked.

OPTION A

Lightest

Referral

The delivery service introduces interested clients. Rayforce sells, onboards and supports the workspace. Delivery receives a referral fee per subscription.

Fits a delivery service that wants no involvement beyond the introduction.

OPTION B

Recommended

Integrated destination

Rayforce Cloud is listed as a supported delivery destination. Joint onboarding for the feed, each side supports its own layer. Revenue share on resulting subscriptions.

Fits a delivery service that wants the offering visible in its product without owning it.

OPTION C

Deepest

Bundled offering

Delivery sells “delivery plus workspace” under one contract and support model. Rayforce operates the workspace as a subcontractor at agreed rates.

Fits a delivery service that wants to own the whole client conversation.

Open for discussion

Fee or share percentages · who signs the client contract · support SLAs per layer · hosting in Rayforce Cloud versus the client's cloud · co-marketing. None of these need to be decided before the pilot.

10 / 10 Proposed next step

One feed, one client, four weeks. Then a decision.

A pilot small enough to be low-risk for the delivery side and concrete enough to show the client a result they can use.

WHAT THE PILOT NEEDS FROM DELIVERY

One conversation, one candidate feed, and honest feedback on where the boundary should sit.

WHAT RAYFORCE COMMITS

The connector, the workspace and the review for the pilot, no exclusivity, and no change to the delivery workflow.

The Rayforce engine is available today. Rayforce Cloud and the data services are the proposed offering.
